

WE REVOLUTIONIZE AI SO YOU CAN RESPECT PRIVACY AND INTEGRITY.

GDPR and other privacy regulations mandates that organizations perform and document a personal data inventory in all their data sources, including unstructured data.

Respecting privacy and integrity is not only a question of huge fines, devastating damages and badwill. It is also a question of keeping customers, and ensure their long term loyalty. Knowing where personal data are processed, and why, is therefore needed for both compliance and future business success.

Aigine is created to make such an inventory possible, and to ensure efficiency and quality.

To achieve that, Aigine Huginn provides a digital process, where human and machine interactions are enforced by out-of-the box machine trained algorithms.

FILTERS

Aigine scans all data sources using algorithms with StoredIQ and filters out documents with personal data. Documents that do not need reviewing are excluded from the process.

PRESENTS

Aigine uses algorithms to present document content in a web GUI. Personal data are highlighted and marked with the relevant category. This makes the actual reviewing much faster.

EDUCATES

Aigine uses AI to propose the legal ground and contains a contextual knowledge database populated from the Data Protection Authority. This makes the assessment faster and ensures continous privacy training.

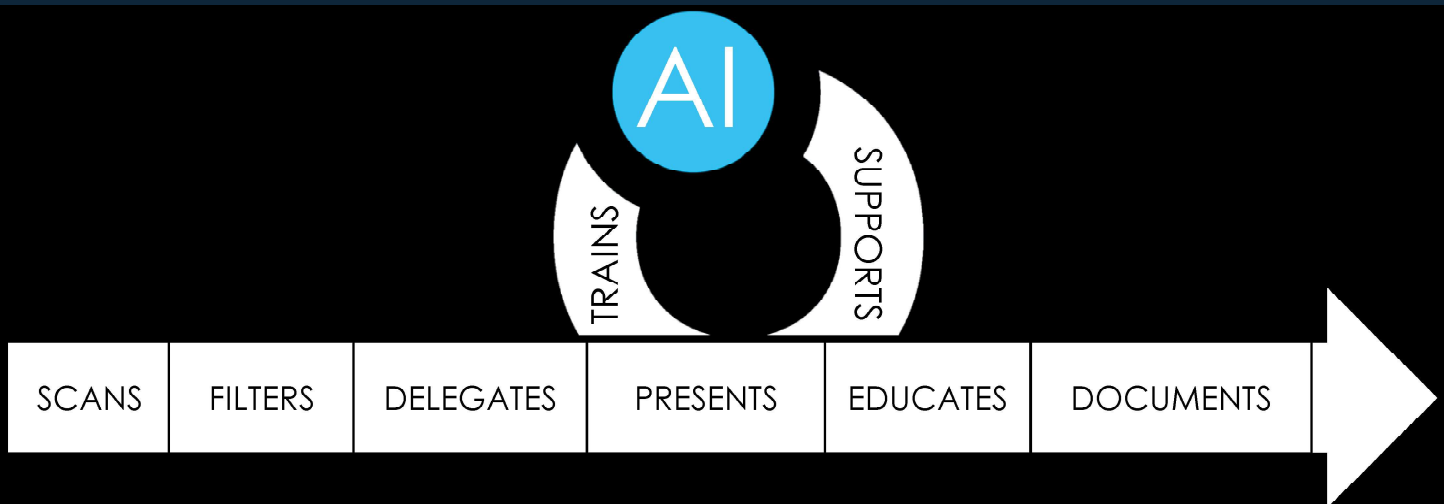

DOCUMENTS

Aigine contains a smart, digital form where all information needed for the records of process activities are documented directly. Time is saved since no further documentation is needed elsewhere.

Aigine revolutionizes how artificial intelligence is deployed and trained by introducing collaborative cognitive learning. We create the code needed for AI-training locally and make sure no information ever leaves your environment. In that way, actual, qualified, human work is used to continuously improve a common instance of AI. These sharpened cognitive abilities are delivered to all users of the system; by better filtration, better highlighting and better proposals for legal ground.

Aigine Huginn is a pre-packaged solution running on world leading software from IBM. In order to avoid time consuming projects, we deliver all software pre-installed and configured on server images.

Aigine Huginn automatically creates the records of process activities, and makes it possible to respond to a data subject request with the click of a button. By using Aigine, personal data becomes separable from other data, making it possible to both save more data and respect privacy.

Aigine is provided as a hybrid on site/cloud SaaS and is available and provided worldwide by IBM vendors.
